1 First Section

This document is an example of BibTeX using in bibliography management. Three items are cited: *The L^AT_EX Companion* book [2], the Einstein journal paper [1], and the Donald Knuth's website [3]. The L^AT_EX related items are [2, 3].

2 Overview

Before we get to the commands and facilities provided by Biblatex, we will have a look at some of its fundamental concepts. The Biblatex package uses auxiliary files in a special way. Most notably, the bbl file is used differently and when using BibTeX as the backend, there is only one bst file which implements a structured data interface rather than exporting printable data. With LaTeX's standard bibliographic facilities, a document includes any number of citation commands in the document body plus **bibliographystyle** and **bibliography**, usually towards the end of the document. The location of the former is arbitrary, the latter marks the spot where the list of references is to be printed
